1 Introduction

In my previous tutorial documents, *L^AT_EX for Beginners*, I demonstrated many basic functions L^AT_EX supports. In this tutorial, I will go over many more of the more advanced uses of L^AT_EX of which most are going to be for specific users. For example, in this document I will go over how to make circuit diagrams in L^AT_EX. That chapter will be very useful for people in the electrical or computer engineering field, but likely would be of no use to someone in a mostly pure mathematical field such as statistics. Please make use of the table of contents, skipping to sections that are relevant to you. If you are here simply to learn (similarly to me as some of these features are not necessarily relevant to my career nor hobbies) please feel free to go through the entire document.
